

Завдання:

I Налаштування реплікації

1. Налаштувати реплікацію в конфігурації: Primary with Two Secondary Members (P-S-S) (всі ноди можуть бути запущені як окремі процеси або у Docker контейнерах) -

<http://docs.mongodb.org/manual/core/replica-set-architecture-three-members/>

- Deploy a Replica Set for Testing and Development-
<http://docs.mongodb.org/manual/tutorial/deploy-replica-set-for-testing/>
- <http://www.tugberkugurlu.com/archive/setting-up-a-mongodb-replica-set-with-docker-and-connecting-to-it-with-a-net-core-app>

```
(ivan@kali)-[~]
$ sudo docker run -d --name node_1 -p 27017:27017 --net lab4 mongo:4.0.4 --replSet "replset"

II Аналіз продуктивності та перевірка цілісності

Аналогічно попереднім завданням, необхідно буде створити колекцію (таблицю) з каунтером лайків. Далі з 10 окремих клієнтів одночасно запустити інкрементацію каунтеру лайків по 10_000 на кожного клієнта з різними опціями взаємодії з MongoDB.

Для того, щоб не було lost updates, для оновлення каунтера необхідно використовувати функцію [findOneAndUpdate\(\)](#)

Приклад використання:

```

db.grades.findOneAndUpdate(
  { "name" : "R. Stiles" },
  { $inc: { "points" : 5 } }
)

```

<https://www.mongodb.com/docs/manual/reference/method/db.collection.findOneAndUpdate/#update-a-document>

5. Вказавши у параметрах *findOneAndUpdate* *writeConcern = 1* (це буде означати, що запис іде тільки на Primary ноду і не чекає відповіді від Secondary), запустить 10 клієнтів з інкрементом по 10_000 на кожному з них. Виміряйте час виконання та перевірте чи кінцеве значення буде дорівнювати очікуваному - 100K

```
(ivan@kali)-[~/pvns/4/1]
$ python concern_with_primary.py
Increment completed with writeConcern=1 and Primary node up
Lasted — 39.18419003486633
```

```
replset:PRIMARY> db.getCollection('like_counters').find().readConcern('majority')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 100000 }
replset:PRIMARY> █
```

```
replset:SECONDARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 100000 }
replset:SECONDARY> █
```

6. Вказавши у парметрах *findOneAndUpdate* *writeConcern = majority* (це буде означати, що Primary чекає поки значення запишеться на більшість нод), запустіть 10 клієнтів з інкрементом по 10_000 на кожному з них. Виміряйте час виконання та перевірте чи кінцеве значення буде дорівнювати очікуваному - 100K

```
(ivan@kali)-[~/pvns/4/1]
$ python majority_with_primary.py
Increment completed with writeConcern=majority and Primary node up
Lasted — 42.61364817619324
```

```
(ivan@kali)-[~/pvns/4/1]
```

```
replset:PRIMARY> db.getCollection('like_counters').find().readConcern('majority')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 100000 }
replset:PRIMARY> █
```

```
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 0 }
replset:SECONDARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 100000 }
replset:SECONDARY> █
```

7. Повторно запустіть код при *writeConcern = 1*, але тепер під час роботи відключіть Primary ноду і подивитись що буде обрана інша Primary нода, яка продовжить обробку запитів, і чи кінцевий результат буде коректним.

Попередньо зменшив *electionTimeoutMillis* на всіх нодах:

```
replset:SECONDARY> rs.conf().settings.electionTimeoutMillis = 2000
2000
replset:SECONDARY> rs.reconfig(rs.conf(), {force: true})
{
  "ok" : 1,
  "operationTime" : Timestamp(1734128365, 1),
  "$clusterTime" : {
    "clusterTime" : Timestamp(1734128365, 1),
    "signature" : {
      "hash" : BinData(0,"AAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA="),
      "keyId" : NumberLong(0)
    }
  }
}
print("Increment completed with writeConcern=1 and Primary node switched")
```

```
(root@kali)-[/home/ivan/pvns/4/1]
# python concern_without_primary.py
node_3
Increment completed with writeConcern=1 and Primary node switched
Lasted — 53.72220849990845 seconds
```

Нода, що світкнулась:

```
replset:SECONDARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 79756 }
replset:PRIMARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 82246 }
replset:PRIMARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 100000 }
replset:PRIMARY> █
```

Інша жива нода:

```
replset:SECONDARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 53752 }
replset:SECONDARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 59107 }
replset:SECONDARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 100000 }
replset:SECONDARY> █
```

8. Повторно запустити код при *writeConcern = majority*, але тепер під час роботи відключити Primary ноду і подивитись що буде обрана інша Primary нода, яка продовжить обробку запитів, і чи кінцевий результат буде коректним.

При *writeConcern = 1* деякі записи можуть губитись під час раптового відключення. При *writeConcern = majority* має виходити очікуваний результат.

```
(root@kali)-[/home/ivan/pvns/4/1]
# python majority_without_primary.py
node_3
Increment completed with writeConcern=majority and Primary node switched
Lasted — 52.708094120025635 seconds
```

Нода, яка світкнулась:

```
replset:SECONDARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 0 }
replset:SECONDARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 100000 }
replset:PRIMARY> db.getCollection('like_counters').find().readPref('secondary')
{ "_id" : ObjectId("675c2eebbe7e08d46fa8d6b2"), "user_id" : 1, "likes" : 100000 }
```

В моєму випадку (принаймні для одного запуску), і при *writeConcern = 1*, і при *writeConcern = majority* кінцеві значення каунтерів були коректними.
